PATENT SPECIFICATION

Convention Date (Germany): May 12, 1932.

No. 13,761 / 33, Application Date (in United Kingdom); May 11, 1933.

Complete Accepted: June 28, 1934.

COMPLETE SPECIFICATION.

AUG I I 7003

GROUP 1700 Process for Producing Fast Dyeings and Printings on Animal Fibres by Means of Acid Mordant Dyestuffs.

We, DURAND & HUGUENIN A.G., a body corporate organised according to the laws of Switzerland, of 40, Fabrikstrasse, Basle, Switzerland, do hereby declare the 5 nature of this invention and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:-

Acid mordant dyestuffs could hitherto 10 be sufficiently fixed in printing on wool with chromium mordants only after a steaming operation of long duration, namely of one hour and even longer. In the case of certain articles however a 15 long steaming operation is a disadvan-tage, quite apart from the consumption of time and of steam in that in over printing on light ground shades, for example, the ground shade becomes yellow.

20 yellow. The present invention consists in a process whereby acid mordant dyestuffs can be fixed on wool so that they are completely fast by means of a short 25 steaming operation, such as steaming for 8 minutes in a Mather-Platt apparatus. For this purpose it has been found necessary to use in the printing paste a substantial proportion, namely, at least 4 30 per cent., of a non-volatile organic carboxylic acid, such as oxalic acid, tartaric acid, citric acid, adipic acid and the like, whereby the acid conditions which promote the fixation of the dyestuff on animal fibres are apparently maintained throughout the whole steaming operation. The simplest procedure consists in adding a sufficient quantity of such an acid to the printing paste. Printing pastes which contain free acid are, however, frequently insufficiently stable. The desired result can also be attained by forming the acid in the printing paste by dissociation during the steaming operation; for this 45 purpose there may be added to the paste at least 4 per cent. of, for example, an ammonium salt of the acid or a corresponding chromium salt, such as chromium oxalate, chromium tartrate, chromium citrate and so on. It is also possible to combine these various possi-

volatile organic carboxylic acid to a printing paste containing an ammonium salt or a chromium salt of such an acid, or both, is useful for the purpose of the invention.

412,391

Besides having the advantage that it shortens the duration of the steaming operation, the process in accordance with the invention leads to prints which are appreciably fuller and have an improved fastness to rubbing. In most cases these results can be enhanced by the simultaneous use of urea or thiourea in the printing paste.

The process of the invention is applicable not only in the case of wool, but also in the case of silk and the like and to animal fibres in general. The process is useful not only in actual printing processes but also in the production of padded

dyeings on the aforesaid fibres. In hitherto known printing prescriptions the use of, for example, ammonium oxalate, oxalic acid or tartaric acid has already been indicated. However, the quartity of these substances hitherto used; namely, up to at most about 3 per cent., was evidently insufficient for the purpose of the present invention, since in the case of printing acid mordant dyestuffs or wool a steaming operation of 1-2 hours was always necessary for completely fixing the dyestuff. In the printing process of the present invention ammonium oxalate or another of the aforesaid ammonium salts is added to the printing paste in quantities of at least 4 per cent.

The following Examples illustrate the invention the parts being by weight:-

| Example 1. Parts. | 95 |
|---------------------------------|-----|
